## Description

This module is placed inside a switch's output and in parallel with LED lighting. This module avoids annoying flashing caused by switches, most of all the ones that have a small pilot light. LED lighting does not require a lot of current to work. **By putting this LED adaptation module in parallel, we can avoid lights flashing when turned on.**

\*It's recommended that this module be included in electrical LED installations that require a minimal charge, like classic switches, tactile switches, dimmers and switches with pilots, etc.
